

Setarea accesului direct la protectie (cheia WMEnterprise)

Setarile legate de accesul la protectia SRM se configureaza de pe server folosind Admin Control Center. Acesta este un utilitar de management al licentelor de tip Web-based.

Pentru a lansa Admin Control Center trebuie sa accesati pagina <http://localhost:1947>.

Acesta are configurari implicite care in mod normal asigura functionarea corecta a aplicatiei.

Setarile realizate sunt salvate in fisierul hasplm.ini la adresa specificata in partea de jos a paginii de configurare - c:\Program Files\Common Files\Aladdin Shared\HASP\hasplm.ini

Mecanismul de cautare broadcast a protectiei in retea poate fi blocat. In acest caz va trebui sa dezactivam acest mod de cautare si sa specificam explicit adresa serverului astfel:

1. Intrati in Admin Control Center de pe server la pagina de configurari ("Configuration")
2. Dezactivati modul "Broadcast Search for Remote Licenses"
3. In campul "Specify Search Parameters" introduceti IP-ul serverului. Daca WMEnterprise10 va rula si din afara retelei locale se vor completa atat IP-ul intranet cat si cel internet.
4. apasati butonul "Submit"
5. Copiati fisierul obtinut pe server in c:\Program Files\Common Files\Aladdin Shared\HASP \ **hasplm.ini**, pe fiecare din statiiile din retea care folosesc WMEnterprise10, in acelasi director c:\Program Files\Common Files\Aladdin Shared\HASP

The screenshot shows the configuration interface for the HASP License Manager Admin Control Center. The main window title is "Configuration for HASP License Manager on SERVER". On the left, there's a sidebar with various administration options like HASP Keys, Products, Features, Sessions, and Help. The main content area has several tabs: Basic Settings, Users, Access to Remote License Managers (which is currently selected), Access from Remote Clients, and Detachable Licenses. Under the "Access to Remote License Managers" tab, there are three checkboxes: "Allow Access to Remote Licenses" (checked), "Broadcast Search for Remote Licenses" (unchecked), and "Aggressive Search for Remote Licenses" (unchecked). Below these checkboxes is a text input field labeled "Specify Search Parameters" containing the IP address "xxx.xxx.xx.xxx". At the bottom of the configuration page, there are three buttons: "Submit", "Cancel", and "Set Defaults". The status bar at the very bottom of the browser window displays the file path "C:\Program Files\Common Files\Aladdin Shared\HASP\hasplm.ini".

Aceasta modificarare poate fi facuta direct in fisierul hasplm.ini de pe serverul de hasp:

```
...
[REMOTE]
broadcastsearch = 0
aggressive = 0
serversearchinterval = 30
serveraddr = xxx.xxx.xx.xxx
...
```

In directorul in care este instalata aplicatia WMEnterprise10.exe trebuie sa existe si fisierul **nethasp.ini** in care va trebui sa dezactivati modul de cautare broadcast si sa specificati IP-ul serverului. Daca aplicatia va rula din afara retelei locale se va specifica de asemenea IP-ul internet.

```
[NH_COMMON]
NH_SESSION=5
NH_TCPIP=Enabled

[NH_TCPIP]
NH_TCPIP_METHOD=UDP
NH_USE_BROADCAST=Disabled
NH_SERVER_ADDR=xxx.xxx.xx.xx(intranet),xxx.xxx.xx.xx(internet)
NH_SESSION=5
```

Observatie: Verificati daca porturile sunt deschise: 475 - HASP LM si 1947 - HASP SRM.
